

Rani Mehta – BG3/G3

San Francisco, CA | r.mehta@email.com | (415) 555-0421 | github.com/ranim-dev | linkedin.com/in/ranimehta

About Me

I am a women in tech and a software engineering candidate at UC Berkeley with a focus on **distributed systems and backend reliability**. Experienced in building production-ready APIs and optimizing high-throughput data pipelines with a focus on **latency reduction and system uptime**.

Education

University of California, Berkeley

Bachelor of Science in Computer Science | 2022 – 2026

Technical Skills

Languages: Java, Python, SQL, JavaScript, C++, Go

Frameworks: Spring Boot, FastAPI, Node.js, Express, React

Databases: PostgreSQL, Redis, MySQL, MongoDB

Tools: Docker, AWS (EC2, S3, RDS), GitHub Actions, Kubernetes, Terraforms

Experience

Software Engineer Intern Plaid — San Francisco, CA | May 2025 – Aug 2025

- Re-architected an **OAuth data-sharing service** in **Java (Spring Boot)**, increasing connection stability by **44%** for 200k+ daily active users.
- Implemented a **Redis-backed rate-limiting engine**, reducing downstream server load by **30%** during peak traffic bursts.
- Decreased API error rates by **52%** by migrating legacy error-handling logic to a centralized middleware with **99.99% reliability**.

Backend Engineer (Contract) Arcadia Financial — Remote | Jan 2024 – Apr 2025

- Developed **FastAPI microservices** for a real-time ledger system, handling **10M+ monthly transactions** with sub-100ms latency.
- Streamlined a **PostgreSQL data migration** for 500GB of historical records, reducing database locking time by **75%**.
- Optimized **CI/CD pipelines** in GitHub Actions, reducing build-to-deploy time by **40%** and ensuring 100% test coverage for mission-critical modules.

Projects

"Hydra" | High-Throughput API Gateway

- Built a custom API Gateway using **Node.js and Express** that aggregates 5+ downstream services into a single GraphQL entry point.
- Reduced aggregate response times by **35%** through **parallelizing asynchronous requests** and implementing a multi-tier Redis cache.
- Secured endpoints using **JWT-based authentication** and automated IP-blocklisting, preventing **95% of brute-force attempts** during stress testing.

Tech Stack: Node.js, Express, Redis, Docker, PostgreSQL.

"Argus" | Distributed Log Analyzer

- Developed a **Python-based log processing engine** that scans system logs for security anomalies, identifying threats with **98% accuracy**.
- Integrated **AWS S3 and RDS** to store and query 2TB+ of log data, optimizing query speed by **50%** through partitioned table structures.
- Designed a **React-based monitoring UI** with live-updating charts (WebSockets), reducing the mean time to detect (MTTD) issues by **15 minutes**.

Tech Stack: Python, FastAPI, React, PostgreSQL, AWS (S3/RDS).
