About Me

Software Engineering candidate specializing in **distributed systems** and **cloud-native architecture**. Experienced in building event-driven microservices and high-availability data pipelines. I prioritize **system reliability, scalability, and developer velocity**.

Education

Georgia Institute of Technology

Bachelor of Science in Computer Science | 2022 – 2026

Technical Skills

Languages: Golang, Rust, TypeScript, SQL, C++, Python

Frameworks: Gin (Go), Apollo GraphQL, NestJS, React, Apache Kafka

Databases: MongoDB, Cassandra, Redis, DynamoDB

Cloud & DevOps: Kubernetes, Terraform, AWS (Lambda, Kinesis), GCP, Jenkins

Core Strengths: Distributed Systems, Event-Driven Design, CI/CD, GraphQL Schema Design

Experience

Software Engineer Intern Datadog — New York, NY | May 2025 – Aug 2025

- Architected a real-time log aggregation service in Golang using Apache Kafka, increasing data ingestion throughput by 45%.
- Reduced cloud infrastructure costs by 22% (\$12k/month) by refactoring AWS Lambda functions and optimizing resource allocation via Terraform.
- Decreased p99 query latency by 55% for the metrics dashboard by implementing a write-through cache with Redis and Cassandra.

Backend Engineer (Contract) Nebula Cloud Solutions — Remote | Jan 2024 – Apr 2025

- Migrated a monolithic legacy system to a microservices architecture using NestJS and GraphQL, serving 75k+ active users.
- Automated a multi-region deployment pipeline using Kubernetes (EKS) and Jenkins, reducing deployment downtime by 88%.
- Refactored the authentication service to use OAuth 2.0 and JWT, reducing unauthorized access attempts by 74% through improved token validation.

Projects

"Nexus" | Real-Time Collaborative Workspace

- Developed a collaborative document editor using **Rust** and **WebAssembly (WASM)**, achieving a **70% reduction in sync latency** compared to standard JSON polling.
- Implemented **Conflict-free Replicated Data Types (CRDTs)** to ensure **100% data consistency** across 1,000+ concurrent user sessions.
- Built a custom **GraphQL Subscriptions** layer that reduced client-side data over-fetching by **42%** using selective field updates.

Tech Stack: Rust, React, GraphQL, WebAssembly, MongoDB.

"KubeWatch" | Automated K8s Autoscaler

- Engineered a custom **Kubernetes Controller** in **Go** that triggers pod scaling based on custom memory-pressure metrics, improving cluster efficiency by **33%**.
- Integrated **Prometheus** and **Grafana** for observability, providing real-time health metrics with a **99.9% alerting accuracy rate**.
- Reduced cold-start times for microservices by **50%** by optimizing **Docker** multi-stage builds and container image layering.

Tech Stack: Go, Kubernetes API, Prometheus, Docker, Helm.
