

# Miles CODEWELL

**Location:** San Francisco, CA | **Email:** j.codewell@email.com  
**LinkedIn:** [linkedin.com/in/jcodewell](https://www.linkedin.com/in/jcodewell) | **GitHub:** [github.com/jcodewell](https://github.com/jcodewell)

## ABOUT ME

Full-stack Software Engineer with 4+ years of experience building scalable web applications and distributed systems. Passionate about clean code, mentored 3 junior devs, and obsessed with optimizing latency. I thrive at the intersection of robust backend logic and intuitive UI/UX.

## TECHNICAL SKILLS

| Category        | Technologies                                                      |
|-----------------|-------------------------------------------------------------------|
| Languages       | Java, Python, TypeScript, SQL, Go                                 |
| Frameworks      | Spring Boot, React, Node.js, Django                               |
| Cloud & DevOps  | AWS (EC2, S3, Lambda), Docker, Kubernetes, CI/CD (GitHub Actions) |
| Tools/Databases | PostgreSQL, Redis, MongoDB, Git, Jira                             |

## PROFESSIONAL EXPERIENCE

### Senior Software Engineer | TechFlow Solutions *Jan 2022 – Present*

- Architected a microservices-based payment processing system using **Go** and **Kafka**, reducing transaction failures by 15%.
- Optimized database queries in **PostgreSQL**, leading to a 40% improvement in page load times for over 500k monthly active users.
- Led the migration of legacy monolithic infrastructure to **AWS Lambda**, resulting in a \$12k/month reduction in server costs.

### Software Engineer | StartupGen *June 2019 – Dec 2021*

- Developed and maintained 10+ core features for a customer-facing dashboard using **React** and **Node.js**.
- Implemented automated unit and integration testing (Jest/Cypress), increasing code coverage from 60% to 92%.
- Collaborated with cross-functional teams to define API specifications and UI mockups.

## PROJECTS

### Distributed Task Scheduler | *Go, Redis, gRPC, Docker*

- Designed and implemented a high-availability task scheduling system capable of handling **10,000+ concurrent jobs** with sub-second precision.
- Utilized **Redis Sorted Sets** to manage task priority and execution timing, preventing race conditions in a multi-worker environment.
- Implemented a **gRPC interface** for low-latency communication between the scheduler and worker nodes, reducing overhead by 30% compared to REST.
- Key Challenge:** Solved the "double-execution" problem by implementing idempotent task processing with unique execution tokens.

### AI-Powered Code Reviewer (Open Source) | *Python, OpenAI API, GitHub Actions, FastAPI*

- Created a CI/CD tool that automatically critiques Pull Requests for security vulnerabilities and "code smells" using Large Language Models.
- Built a **custom caching mechanism** to avoid redundant API calls on unchanged code blocks, saving ~40% in token costs.
- Deployed the service as a **GitHub Action**, currently used by 3 active open-source repositories to streamline the peer-review process.
- Developed a feedback loop where users can "upvote/downvote" AI suggestions to fine-tune the prompt engineering logic.

## EDUCATION

### B.S. in Computer Science University of Technology | *Graduated May 2019*

- Relevant Coursework:** Data Structures & Algorithms, Operating Systems, Database Management, Software Architecture.
